

**APPARATUS AND METHOD FOR ENABLING DATABASE BATCH UPDATES
WITHOUT MODIFYING GENERATED CODE**

ABSTRACT OF THE DISCLOSURE

5 An apparatus and method enable batch processing of database updates without modifying generated code, *i.e.*, without redeployment of the application server or application. A batch mechanism intercepts calls from the generated code, compiles updates into batches, and processes the updates to the database in batches. In this manner the batch mechanism takes advantage of the batch processing capabilities of the database without modifying the generated code.
